

## Helix Forensics:

for·ensic – to find :  
find the truth

Computer Forensics may be a new and emerging trend but that shouldn't mislead you from the benefits that can be achieved by retaining an Expert Forensic Investigator.

These statistics may sound familiar; 85% of all corporate data is stored electronically, 93% of new data is stored electronically, and approximately 75% of this information is never printed. Consequently, in almost every legal matter, critical and relevant evidence will be stored electronically. Proper collection and examination of this evidence is critical to avoid spoliation, to preserve the evidence, and to manage cost.

Our investigators can analyze and reconstruct the who, what, where, when, and how the incident occurred giving you the leading edge in litigation and investigations while preserving the essential chain of custody protocols and forensic soundness of the original evidence.

In today's digital world most evidence is likely to be digital in nature. Without the assistance of a trained IT forensics expert it is likely you will contaminate or destroy valuable evidence that could hamper your investigation, or in the case of litigation – cost you your case. A computer forensics investigation, performed by a certified forensics expert, can help you uncover the truth about a given situation, allowing you to take appropriate containment and remediation actions based on the facts. With respect to litigation, proper computer forensics can give you an extreme edge over opposing council.

So what exactly is Computer Forensics? It is the scientific process of acquiring and analyzing information stored in any electronic format, for the purpose of preserving its integrity, investigating allegations, finding the facts, and presenting the findings.

Electronic discovery poses new challenges and opportunities for attorneys, their clients, technical advisors, and the courts, as electronic information is collected, reviewed, and produced.

In 2006, the U.S. Supreme Court's amendments to the Federal Rules of Civil Procedure created a category for electronic records that, for the first time, explicitly named emails and instant message chats as likely records to be archived and produced when relevant.

For both computer forensics and E-discovery, Investigators must be trained in the latest techniques and tools available to validate their findings. Secure DNA addresses this by using only forensic investigators who have prior law enforcement experience and are subject matter experts capable of providing expert witness testimony. All of our tools and methods have been tested and evaluated to validate their accuracy and reliability.
